Human capital features prominently in theoretical work on post-entry performance of new firms. Empirical literature has, however, to a large extent overlooked the unobserved component of human capital focusing on years of education or labor market experience. We investigate whether focus on the unobserved dimension of human capital can enrich our understanding of the link between human capital and performance of new firms.

Polina Knutsson is a Ph.D. Candidate at Lund University, Sweden. A central theme of her research is the role of new and small firms in the industrial dynamics.
